Beginning with AutoCAD 2014, it supports the DCC-SOLID object exchange protocol. The DCC-SOLID object exchange protocol was originally developed by the now-defunct DCC Software, Inc. and in AutoCAD 2014 and later releases are proprietary. When the DCC-SOLID protocol was developed, most computer aided drafting and design (CAD/CAM) software applications did not support the object exchange protocol. History AutoCAD was originally developed by a team of drafters at Arthur Allen's company, AARON (ACAD Corporation), as a replacement for the then popular Xerox CADRX which is also known as Xerox CAD, Viewpoint and Alias. The

Xerox CADRX was a package of software programs that could be used to communicate with, among other products, a Xerox 364 graphics terminal, and was provided free of charge for a trial period. The Unix operating system provided the operating system under which the software was to run. The first release of AutoCAD was based on the Xerox 3800 VDU terminal. In May 1983, a licensing agreement was signed with Xerox so that the software could be commercially available, and by October 1983, this version was released. The first AutoCAD desktop publishing package (AutoCAD Text), designed for desktop publishing, was released with the release of version 1.1 of AutoCAD in December 1983. In October 1983, a software development kit (SDK) was released, and in February 1984, the company was re-organized and became its own corporation, the ACAD Corporation. By 1987, the company was making \$40 million annually. In December 1987, the ACAD Corporation released AutoCAD LT, a less expensive version of the application. In 1988, the software was ported to the Apple Macintosh operating system. The first port was released in March 1988, with the code-name "Villa". The first commercial release of AutoCAD LT for the Macintosh was released on 1 July 1988. The release of AutoCAD LT for the Macintosh was accompanied by an innovative feature called "app-docking", which allowed multiple applications (not just one like AutoCAD) to be docked onto the desktop of an Apple Macintosh computer. The docking feature allowed a user to dock one application within the Dock, which was located at the bottom of the screen, allowing the user to access the main program's menu and documents without
