Myeloma is the second most common form of hematologic malignancy after lymphoma. The disease is usually incurable, with median survival from diagnosis to death of approximately 3 years. Most treatment options only ameliorate symptoms with modest benefits. Allogeneic hematopoietic stem cell transplantation is a promising treatment that has shown survival benefits in the post-autologous transplant setting. There has been a dramatic decrease in transplant mortality and a shift in the treatment paradigm to reduce the reliance on high-dose chemotherapy and the use of post-transplant consolidation or maintenance therapy. New chemotherapeutic agents that are more potent than existing drugs and less toxic have significantly improved the outcomes in patients with multiple myeloma. In particular, the use of immunomodulatory agents that harness the activity of cytotoxic T-cells and natural killer cells has been extremely important, and studies have explored various strategies to target specifically tumor cells. In this review, the current and emerging therapies for the treatment of myeloma are discussed.Q: All possible combination of numbers and letters and taking only odd numbers and letters from textbox I want to generate all possible combination of numbers and letters and taking only odd numbers and letters from textbox. I know for a number, int[] max = {255,512,814,1255,1657,1957
