Senators press administration for list of NSA spying targets Some members of the Senate Intelligence Committee have grown impatient with the administration's lack of cooperation in providing information to Congress about warrantless wiretapping. During a classified briefing, the senators learned about a database of phone numbers called the National Security Agency's PRISM program, but they were unable to determine whether the program covered any of their own communications. The senators asked for the program's original targets, but they were told they were kept secret and could not be shared with the Committee. On April 11, David Axelrod told the Committee that the White House had provided the list of PRISM's targets. But

Committee chairman Senator Pat Roberts, an Oklahoma Republican, said the President's unilateral disclosure might be a violation of federal law. "If you give a list of one, you're probably giving a list of all," he said, citing the Communications Act. The White House did not respond to a request for comment. Proposed amendments to the Fourth Amendment, contained in the

USA Freedom Act, would require court approval for certain intelligence activities. But that language does not apply to the PRISM program. Wired News' Tom Knudson has also been told that the intelligence community has not worked with the NSA on the PRISM program. Reps. Jim Sensenbrenner, R-Wisc., and Mike Rogers, R-Mich

Software as a Service (SaaS) is a business model that allows companies to outsource their IT departments and all of the software and hardware that is part of their daily operations. It is a new way for businesses to run their IT departments, and with the constant improvement and development that is happening in the SaaS world, it is easy to see why businesses are switching to the cloud. SaaS is pretty simple in that it allows organizations to save money and ease the burden of managing and hosting the complex software that is required for a company to operate. For the user, SaaS is just a simple software application that is accessed from a web browser or mobile device, which is much easier than installing and configuring the software that would be required to use software that was designed for a specific device. SaaS is a very user-friendly service. One of the best advantages of SaaS is that it is simple to use, since most SaaS applications are web-based and require only a web browser. With SaaS, there is no need for users to install anything on their PCs. This means that even if the user changes the default web browser, all that is required is to update it to reflect the new browser. With SaaS, there is no need for the user to worry about finding out where the software is installed. They simply log in to their user account from the web, and then choose to log in to a particular web application. Over the years, SaaS has changed a lot. There are different forms of SaaS today. In the beginning, SaaS was just a place where companies would store their software and data. This meant that people had to go to a computer and type in their login information to access that specific piece of software. This form of SaaS is still common today, but most people now use web-based applications that can be accessed from a web browser or smartphone. It is quite simple to see why SaaS is so popular today. Instead of having to download, install, and configure a piece of software on their own PC, users just need to log in to their account and then choose to log into a particular piece of software. All that is required is a web browser. Hardware as a Service (HaaS) is basically just a reverse of the SaaS model. Instead of going from software to hardware, the hardware is usually put on a server and the software
