learn more about this application. This manual explains how to use the drawing tools of AutoCAD to create objects, edit existing objects, and draw a 2D or 3D drawing. You can use AutoCAD for

2D or 3D objects. The recommended standard platform for using AutoCAD is the Windows operating system, as this is the most popular platform. However, you can run AutoCAD on other

operating systems, such as Mac OS or Linux. AutoCAD has a platform-independent architecture. If you are using a mobile platform (for example, a smartphone or tablet) and you access an

AutoCAD file, all standard editing functions work as if you were on a standard PC. You can use AutoCAD for 2D or 3D objects. Creating drawing templates. To do most of the things

you can do with AutoCAD, you need to have a drawing template (also called a project). The best way to create a drawing template is to create it manually by using the drawing tools. You can

also use the drawing template wizard to create a drawing template. This is convenient because the wizard generates many useful drawing templates for you. You can create a drawing

template to start a 2D project, edit an existing project, or create a 3D model. Creating a drawing template The drawing template wizard creates drawing templates that are generally appropriate

for most types of drawings. In the drawing template wizard, create a drawing template called "AutoCAD V" and save it. You can call this template "AutoCAD V" or

"AutoCAD V drawing template" to distinguish it from other AutoCAD projects you create. For example, this is the template for an architectural project. It has a 2D drawing area, 3D

modeling tools, and workplane tools. Creating a 2D drawing template To create a 2D drawing template, follow these steps: In the drawing template wizard, in the "Choose Project Type" list on

the left, click "2D drawing." In the "Choose Project Type" list on the left, click "2D drawing." In the "Create a Drawing Template" wizard, in the "Name your template" text field,

type the name

terminal domain of alpha-santalene synthase from trans-farnesol producer Streptomyces sp. S133. Alpha-santalene synthase (α-SAS) catalyzes the conversion of farnesyl

pyrophosphate (FPP) to a terpene alpha-santalene. The catalytic domain of α-SAS from Streptomyces sp. S133, designated St-HPSAS, was overexpressed and purified as a recombinant protein. St-

HPSAS was crystallized and its structure was determined by the single-wavelength anomalous diffraction method. The asymmetric unit contains one molecule,

and the crystal diffracted X-rays up to 1.9 Å resolution. The final model was refined to a final R-factor of 0.16 and a good stereochemistry. In the complex with the substrate analogue

FPP, St-HPSAS adopts an open conformation with the substrate-binding cavity open to the solvent. The catalytic mechanism and the binding pattern of FPP are conserved in comparison with the

terpene synthases known in the literature.Q: How to change the value of attribute through the Django ORM in the form view? I'm developing an app in Django 1.6. I have a
