Android full SDK .[Thyrotoxicosis during pregnancy]. Thyroid disorders during pregnancy occur in about 1/1000 pregnancies. This prevalence is about 30 to 50 times higher than the general population. The most common of these disorders is Graves' disease, characterized by the hyper-thyroidism and hyper-calcemia. The thyrotoxicosis is rarer than expected in the pregnant women. If the thyrotoxicosis occurs, due to the specific hormonal changes occurring during pregnancy, it is usually subclinical. But if the thyrotoxicosis is severe, it may cause significant neurological and cardiac complications. In this cases, the treatment must be adapted according to the stage of pregnancy, the severity of the condition and the risk of complications. Chromatin has emerged as a key target for many classes of drugs. The epigenome, the complex pattern of chemical modifications that modulate chromatin structure, is regulated by several epigenetic enzymes: for example, DNA methyltransferases, histone acetyltransferases (HATs), histone deacetylases (HDACs), histone methyltransferases and histone demethylases. The wide number and diverse activities of these enzymes enable the possibility of targeting one or multiple chromatin modifications. While the use of drugs that modulate chromatin is emerging, our understanding of their benefits and drawbacks is limited. Importantly, most, if not all, epigenetic drugs are believed to function by directly or indirectly altering chromatin structure. However, since d0c515b9f4
