Possible solutions: df -L output file that does not have the -rwxrwxr-x. Files in nautilus of the sizes of more than 100MB are still not shown. However, if the file size is very small (less than or equal to 100MB, for example 10MB), then this problem will not occur. I use a PC with 8 GB RAM. I also do not use an SSD (at least now not), but use a hard disk. I am using Ubuntu 10.04 LTS. I have checked some possible solutions for these problems, but to no avail. I am in no way familiar with these things, but somehow I just do not know where to start. I have searched a lot on the Internet, and have seen many suggestions and tutorials, but they all consist of various advice and recommendations for various operating systems, which I am unfamiliar with. Some of these suggestions include: remove.thumbnails folder from ~/Photos remove those Photos/fine.png files restore your precious photos from your backup delete the thumbnails cache files reinstall the thumbnails package give thumbnails enough disk space Which of these suggestions would be most appropriate for my case? Are all of these possible solutions okay, or are some of them not appropriate? If not, please explain. A: As written in the comment this was a problem due to the SSD I used for my computer. When the hard disk (my 16 GB SSD) is full of data and after using some applications, the data from those applications are saved temporarily in the memory area of the RAM (random access memory). In my case, for the applications that store the data in the RAM, the filesystem for the SSD was filled up and created a new.thumbnails folder, with.thumbnails.db inside it. I guess the new folder in your case was too large, but the keys and the data saved inside it do not really fill up the memory area, but fill up the SSD. As a result you only see the thumbnails of the last 100MB of your files on your computer. Search It's been a while since I played with my camera, and, in fact, it's been months since my last post was an actual photo of my cat. So, it's time to pull up the camera and start taking some pictures again.

Always follow the laws! Development and validation of a norm-referenced instrument for assessing the self-concept of individuals with Down syndrome. A norm-referenced instrument was developed and validated to assess the self-concept of school-aged children and adolescents with Down syndrome. The 91 items of the instrument were based on the following theoretical considerations: (a) the participants were examined because of their impairment of the ability to use social cues to know themselves, (b) the participants' self-concept was conceptualized as a single construct (e.g., identity), and (c) the participants' self-concept was considered to be an important indicator of their competence. This instrument was applied to 194 school-aged children and adolescents with Down syndrome. A confirmatory factor analysis of the self-concept construct found support for the two-factor structure of the self-concept (self-evaluation vs. social acceptance). Intercorrelations between the self-concept factors were moderate and moderate-to-high with the other facets of identity and competence, respectively. The validity of the instrument was supported by its stability and its association with the level of general competence and adaptive behavior.[The importance of caregivers in the access to oral health services]. This study analyzed the influence of caregiver's age, sex, schooling, economic status, and occupation on the access to oral health services in a target group of elderly patients over 65 years of age at a university hospital. The research used the theoretical framework of the rights approach to health and the idea of the public health. A sample of 1,190 elderly people in a University Hospital was randomly selected. The dependent variable was the participants' access to health services. The independent variables included caregiver's age, sex, schooling, economic status, and occupation. Descriptive and bivariate analysis was performed using the SPSS program. The results showed that caregiver's age was associated with the following variables: health services, level of schooling, economic status, and social level. However, 648931e174

No. of Files : 13 Size : 43.19 GB You can download from here on the top menu, Bittorrent or any other server, just click the first download link and search a link to mirror. How to mount windows folders in Linux I copy my content in linux created directories that I want. But now i want make them as my windows drives. How Can I do that? A: There are some applications that make this a little easier. One example is called "CIFS File System" which you can find on their website here. (note this is for a Mac/Linux installation. Windows user can use something like this.) However, in addition to this software, mounting your Windows file share is generally done using Samba. If you don't have this installed (and it can be quite hard to install on Windows without rebooting several times), there are alternative ways to mount the share. Try this guide (it is a Windows to Linux tutorial, but should be easy to follow. Or just read the commentaries): Further, if you have used sshfs already, which is a good way of accessing your Windows share, then I would just use that. A: This is the normal procedure for mounting a windows share on Linux: Install Samba Install the samba package. sudo apt-get install samba You can also check the details, version, etc. with sudo apt-get install samba-doc Select the share in a terminal use the smbclient -L IP_ADDRESS The IP_ADDRESS should be changed to match your network/server configuration. You should receive the following output: [1] 10888 Connect from the share host, use the IP_ADDRESS and use the guest account in the terminal type the following: smbclient //IP_ADDRESS/ShareName -U Guest The username here should be the same as the share account name. So in your case: smbclient -L 192.168.

Make sure you only download the swarplug3freedownloadfull14 file! And don't forget to remove the files you have already downloaded! Q: Problem With Retrieving Data From MySQL Database Hello i am having a problem with a database handler in php The code i'm using to retrieve data is this one \$query = "SELECT * FROM trackinglogs WHERE LastLogin='\$lastLogin' AND UserID=\$loginUserID"; \$result = mysql_query(\$query,\$con); if (!\$result) die("Database Error"); while (\$row = mysql_fetch_assoc(\$result)) { echo \$row['DeviceID'].", ".\$row['LastLogin'].", ".\$row['DeviceStatus'].", ".\$row['LastActivity'].", ".\$row['UserID'].", ".\$row['DeviceSerial']; } When i do a var_dump on the \$result variable it shows Warning: mysql_fetch_assoc() expects parameter 1 to be resource, boolean given in /home/adm/public_html/conn_db.php on line 34 I'm sure the query would be correct i'm just not sure why it's returning the above error. A: There is a small typo in your line: \$result = mysql_query(\$query,\$con); The password is missing the \$ \$result = mysql_query(\$query,\$con); A: You are not accessing the result variable. Change this: \$result = mysql_query(\$query,\$con); to this: \$result = mysql_query(\$query,\$con); while (\$row = mysql_fetch_assoc(\$result)) { Social media platforms are full of expletives, profanities and hate speech (Picture: Ian West/PA) Social media platforms are full of expletives, profanities and hate speech, a new study has found. Statistically representative data from 1,000 teens in the US was analysed by tech website Techcrunch, who found that nearly 40% of posts published on Twitter, Facebook, Instagram, YouTube and Tumblr were censored. The study said that the censors took the 'big four' social media networks to task for taking user posts
