Recent data on the efficacy of metformin in the treatment of polycystic ovary syndrome. Polycystic ovary syndrome (PCOS) is one of the most common endocrine disorders with a prevalence of 10-15% in women of reproductive age. It is characterized by anovulatory infertility, hyperandrogenism, polycystic ovaries, and an increased risk of infertility, hirsutism, and gestational diabetes. Metformin, an effective oral antidiabetic agent, lowers blood glucose levels and has been shown to improve insulin resistance and to stimulate the growth of human luteinized granulosa cells. Its efficacy and safety have been demonstrated in PCOS. In this review, we aimed to highlight recent clinical evidence for the use of metformin for the treatment of PCOS. We searched for original clinical trials reporting at least 2 years of follow-up, with a follow-up rate of greater than 70% in randomized controlled trials and meta-analysis. We also searched for randomized controlled trials, cohort studies, and case-control studies in MEDLINE. The search covered the period from January 2000 to May 2010. A systematic review was done for all the studies, and all data were extracted. All the meta-analyses of random-effects were pooled by using Review Manager (RevMan 5.1, The Cochrane Collaboration, Oxford, UK). A good response to therapy was defined as a 2 kg weight loss or a decrease in total cholesterol levels of at least 30% and an increase in high-density lipoprotein cholesterol levels of at least 10%, both observed after the completion of 2 years of treatment. A good response was observed in an average of 25% of women treated with metformin compared to 13% of those who did not receive metformin. The most frequent adverse event was gastrointestinal discomfort, which was seen in 5% of the metformin-treated women and 1% of the control women. A good response to treatment was observed in 25% of PCOS women taking metformin as monotherapy, whereas it was observed in only 13% of PCOS women not taking metformin.
