Once downloaded and unpacked, a 30 second flash cut showed the folder tree that would be expected. The cfw files are pre-downloaded, and a directory tree showing all the Save Games was created with a popular mod. The directory was empty and had no names or dates, but as we have an automatic save setting in-game, there was a saves folder and a my.cfg containing the current setting. The save.htm file in the root directory was quite large, and because it was a file listing, it had to be opened and its contents read and parsed. The sage file has 98.91% compatibility, with the majority of the virus scan time spent uploading files. The scan was close to completion at time 2hr56min, but the log file was not completed until time 3hr and 16min. This suggests that the scan is much less thorough than many virus scan products in common use today. We started with the defaults, and while they are simple and perhaps not immediately intuitive, they do the job of getting you up and running in an effective fashion. An option we found to be useful was checking to see the source of each file when downloading, and selecting only secure URLs. With this option active, we downloaded a number of free RSS feeds from news sites, then manually selected and downloaded various files from those sources. AVG quickly caught all of these viruses, saving us a lot of hassle. ikarus has an interesting set of features, and the gui is neat, although too clean to look too good. the interface has a nice design and looks smart. the layout was clear and the controls were intuitive, with one of the best ratings from the pup group. furthermore, the prices were all reasonable, and our recent run through without any major issues. if only the technical support was top-notch. inevitably, we had a problem with the interface, as it hadnt been updated to include the latest versions of its plugins. however, this was a minor issue, and within a few hours everything was back to normal. even the most basic test was performed without any problems, despite the interface being slightly less slick than when we last looked at it. there were a few minor bugs and issues with the interface, but they were not serious enough to stop us running through the entire test. a few things did stick in our craw though, with one of our most recent runs encountering problems with a corrupted set of urls, which caused the download page to be inaccessible for some time. this is a known issue, and we hope it can be sorted out. we did find that the detection speed improved when the sandbox mode was turned off, but it also resulted in a crash after about three hours.
