Using the binary representation of base 10, base 8 uses 1, 2, 4, and 8. This enables the easy use of base 8 in the form of a calculator with few decimal places, and the conversion to base 8 is usually the preferred way to convert numbers to and from the base 10 representation. For example, the number 28,100 can be represented in base 8 as the binary 10000000. If you enter this binary code into the calculator, you will obtain the value 7100, which is the decimal representation of 28,100. This little tool will help you convert numbers to base 8 and display them as a decimal number. The purpose of this tool is simply to allow you to use base 8 in the same way that you use the base 10 calculator.... 3:32 KB base 8 hex Base 8 Hex is a free utility that converts decimal code to base 8 hexadecimal code. What's New In Base Converter?

You have probably heard of the many examples of mobile applications of Microsoft Windows Phone 7. The API is completely new for this platform and includes many features such as: using the accelerometer for the phone's virtual keyboard, the graphics APIs to use multi-touch, the speech capabilities to deliver your voice directly from the phone to the microphone, and a lot more. With the current version of Windows Phone 7, the famous Internet Explorer 9, the .NET framework, Silverlight and everything else of the current Microsoft OS are available for developers. But Windows Phone 7 isn't the only platform on the block, there is also Nokia's Maemo and their associated developer platform. In this case, their developer platform is a development platform on the Linux kernel architecture, and the operating system is MeeGo. The whole development environment includes Eclipse 3.4, the Mono runtime and the C# and .NET frameworks as well. The development environment will allow developers to write their own applications for Maemo using C++, Java, Python and QML as well as the HTML5 web browser, all of which are based on the Microsoft .NET framework. In addition, the developers will have access to the Nokia N810 tablet, which comes with a SIM card and a full keyboard and touch screen that allows them to write applications for this device. According to the developers, MeeGo will be available as a phone platform at the end of 2011, but many phones are already available. In addition, Nokia is already shipping its SDK for Maemo, which will allow you to develop MeeGo applications and so give you access to the latest versions of the .NET framework, Silverlight and all the capabilities of Windows Phone 7. Some developers have already implemented their own skinned versions of the interface in Maemo and ported their applications to it. For us, the port to the new interface from the original Windows Phone 7 is awesome, but since the touch interfaces are more natural than the physical keyboard and touch screen, we feel that it would be more suitable for developers and users with tablets. We have also seen that the interface and many applications are quite similar to Windows Phone 7, and thus we can expect that many applications will also support the new platform. So, if you are looking for a new platform, and if you're a developer, we think that this is the best alternative to Windows Phone 7.
