Q: Is there any pattern that is a combinatorial analogue to the Big-O notation? Is there any pattern that is a combinatorial analogue to the Big-O notation? Big-O notation is for computational complexity (i.e., the run time) of a function, and has the following general form (Wikipedia):  $f(n) = c \cdot n^d$ , where  $d \in \mathbb{N}$ , and  $n$  is the size of an input. The big-O notation gives a measure of the complexity of a function by simply comparing their growth rates. An alternative way of expressing the Big-O notation is using the following asymptotic form:  $f(n) = \Theta(g(n))$ , where  $g$  is a bounded function.

A: Yes, there is. The asymptotic speed is called big-Theta notation, defined in terms of a function  $g$  as follows:  $f(n) = \Theta(g(n)) = \text{Bigl}(\exists c \in \mathbb{R} \text{Bigr}) \text{Bigl}(\exists n_0 \in \mathbb{N} \text{Bigr}) \text{Bigl}( c \cdot n^d = g(n) \geq 0 \text{Bigr})$  For functions  $f, g$  such that  $f(n) = \Theta(g(n))$  (which include many common functions), the following simple inequalities hold:  $f(n) \leq \Theta(g(n)) \leq g(n)$   $f(n) \geq \Theta(g(n)) \geq \Omega(g(n))$  Note that the first

inequality is just the definition, and the second is a consequence of the above definition, if \$n\_0\$ f988f36e3a
