Adobe's Photoshop Elements 4.3 created an extraordinary impression with its sophisticated photo editing and organizing capabilities. Its secret lies in its ability to recognize the image contents and automatically apply the correct settings for creating images with optimal quality. Easily, Photoshop Elements was able to eliminate all the fuss that comes with traditional photo editing. Get rid of red eye, eliminate the background, easily access exposure, depth of field and white balance settings to achieve professional quality output in a few mouse clicks, and you'll instantly appreciate the power of Photoshop Elements. One thing I am starting to notice with most of the apps I test is that there is an on-going convo going on about it. It's great to have an audience. I've also learned quite a bit about what I don't know. A few other things, however, stick out. For example, maybe I am noticing this more with some apps because I have more time with them, but it seems that almost every one of them has a fully-fledged host app that resides on the computer. To me that seems like a huge waste of resources when one can run the same app using a Mac or PC-hosted app.

Similarly, the latest feature is the direct import of video frame file into Photoshop. And this also include the ability of resizing the video frame into different shape, results that are entirely user-friendly and interactive. The major benefit of this feature is that it helps beautify the video frame, and it preserves the original key frames and frames that enhances the beautification process.
